# The Dairy Farm

Milk is produced by cows on dairy farms. The milk collects in their udders. They need to be milked twice a day.

At milking time the cows walk from their pastures to the milking sheds. They wait for their turn to be milked. Their udders are checked and washed. Then milking machines are attached to the cows teats. The milk flows into collection tanks then the milk is stored at a low temperature.

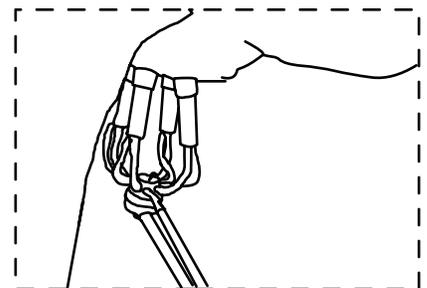

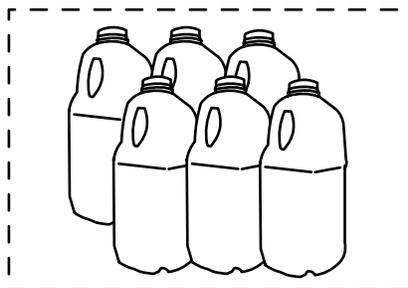

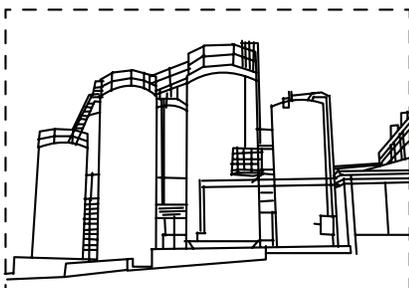

Each day milk is transported in refrigerated tanks to the milk factory. These are some of the collection tanks at the milk factory where the milk will be treated. It is pasteurized to kill any bacteria, then homogenized to mix the cream through the milk.

Finally, it is packaged in bottles or cartons ready for us to drink.  
We love milk!

Cut out the pictures and paste next to the appropriate matching paragraph.

Match the words to their meanings.

refrigerated

Fields where animals graze.

pasteurized

Made or kept cold.

pastures

A process that heats milk to kill bacteria.

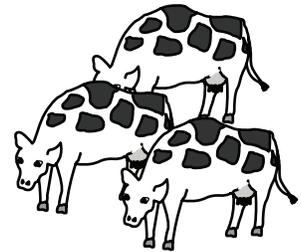

homogenized

A process that mixes cream through milk to stop it separating.

---

Answer the questions.

1) How many times a day are cows milked?

---

2) Where are the cows milked?

---

3) Why do you think the cow's udders are checked and washed before they are milked?

---

4) How does milk get to the factory?

---

5) Why is milk pasteurized before it is packaged?
